# 1. Front-End

## User Interaction

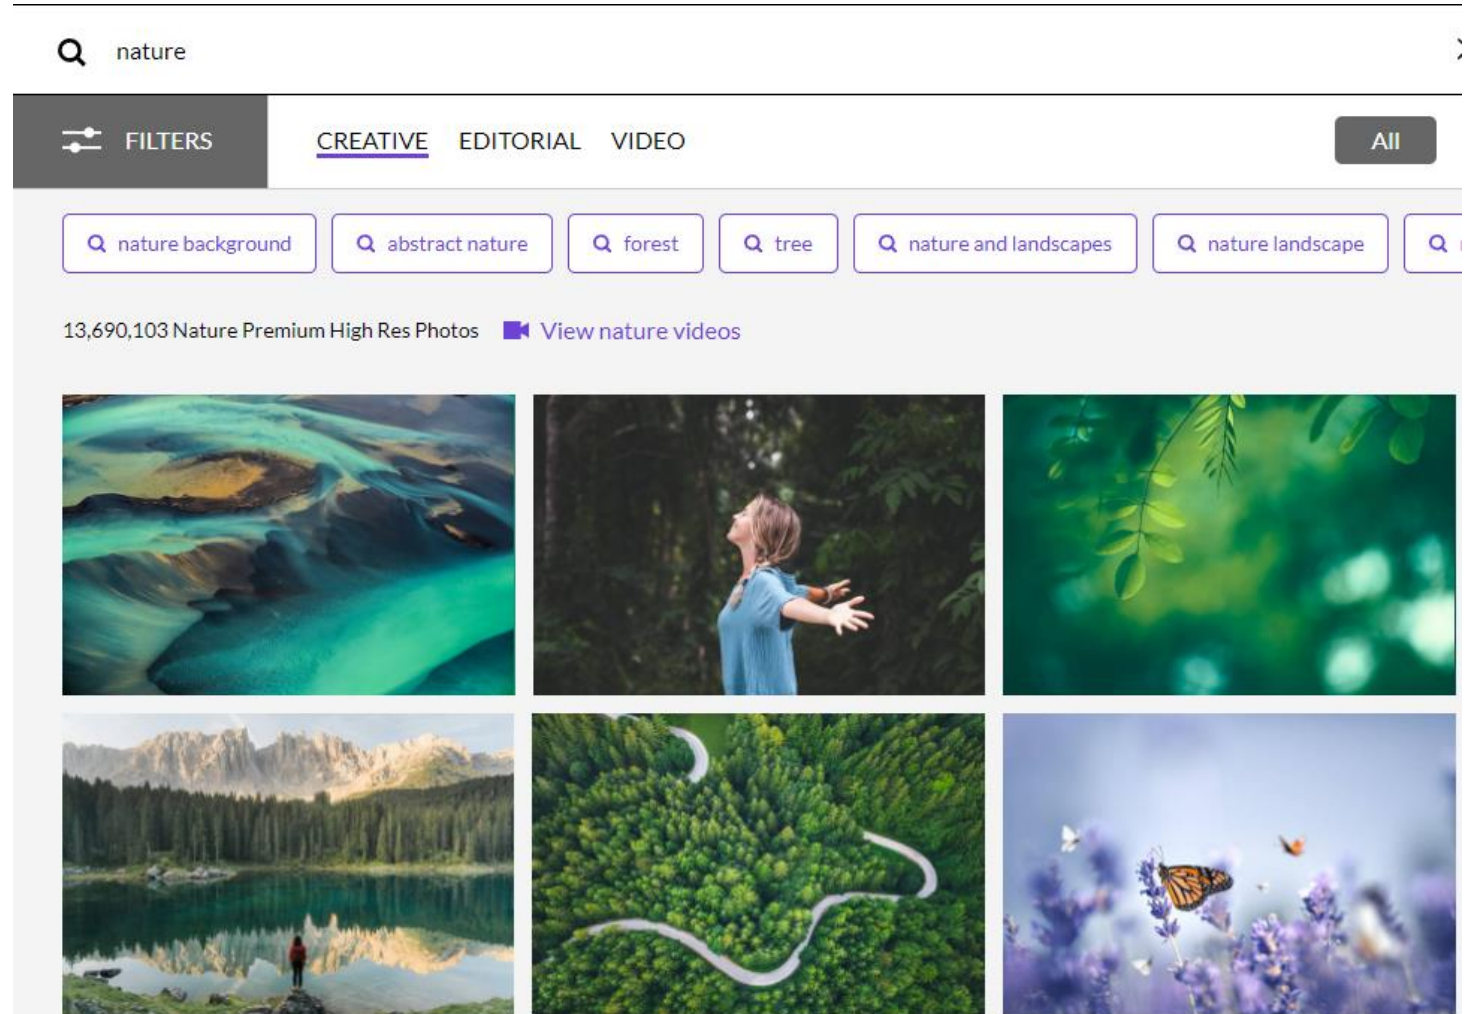

## PyQt5

Python + Qt를 합쳐서 지은 이름으로,  
C++ 기반의 GUI Framework인  
Qt를 Python에서 사용할 수 있게  
만든 패키지

Module

BeautifulSoup

## 2. Model

### Dataset

ImageNet  
ActivityNet  
Kinetic400

(a) headbanging

(c) shaking hands

(e) robot dancing

(b) stretching leg

(d) tickling

(f) salsa dancing

## 2. Model

### Experiments

#### ImageNet

20만장의 이미지만으로 실험  
224 \* 224 resize  
EfficientNet-b0 / Unet  
Result

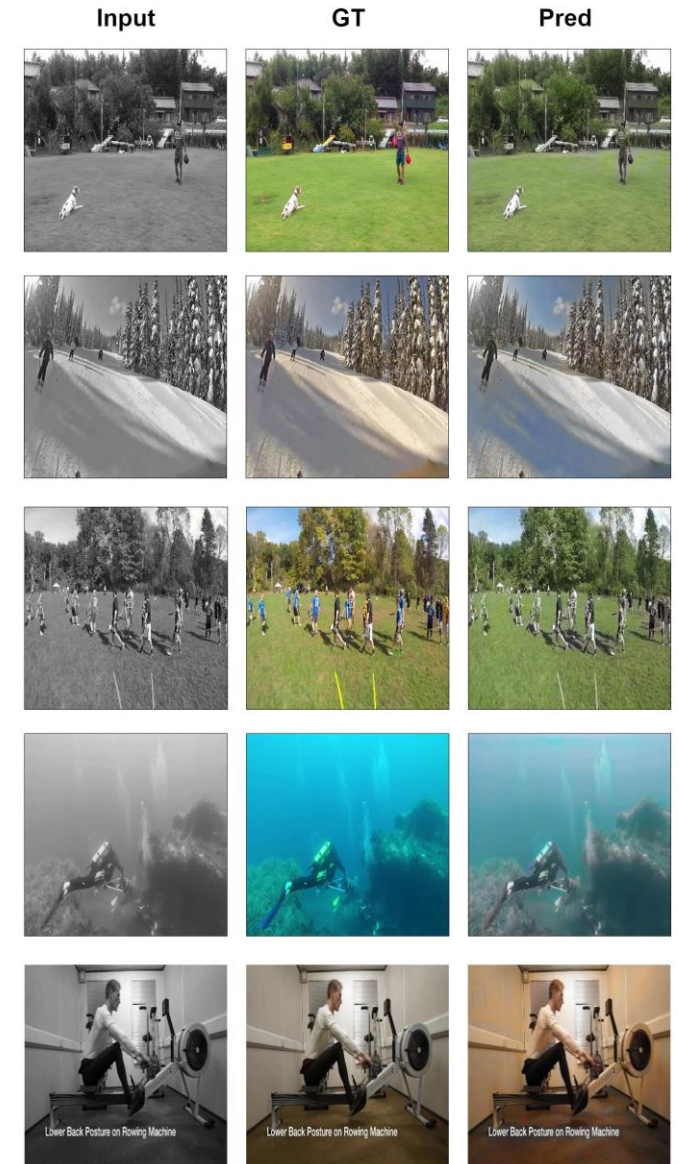

## 2. Model

### Experiments

#### ActivityNet

- 영상 5초에 1frame 씩 이미지 추출
- 480px 이상의 해상도만 선택
- Video\_id를 기준으로 GroupKFold로 train/val split
- 384 \* 384 resize
- 17만장 가량의 이미지 데이터로 실험
- EfficientNet-b0, b4 / Unet

## 2. Model

---

### Discussion

- 384(input) -> 384(output) 과 같이 비효율적으로 이미지 해상도를 사용하기 때문에 학습 속도가 느리고 비효율적임
- 현재는 patch 단위로 학습이 아닌 이미지 전체를 resize하여 학습하기에 작은 객체에 대한 성능이 낮음
- Patch Consistency
- 학습방법

감사합니다
